

AppBoard / Visualization Widgets

Create Live Visualizations with Edge AppBoard

Edge Technologies brings years of visualization expertise and the tools necessary to quickly assemble and display information regardless of the data source or operating system. This expertise brings critical pieces of information from various sources to a single screen, without the need for a major migration or integration project.

Edge's AppBoard solution enables the creation of live, interactive and meaningful dashboard visualizations. Edge's Visualization Widgets Toolkit turns data into hard-hitting, intuitive visualizations in minutes. Edge can also custom-build an AppBoard solution – without the custom-built price tag.

Using new Web 2.0 technologies and standards-based techniques such as Web services, Edge creates dynamic, top-level dashboards based on live data, without requiring heavy programming to create a custom GUI. Real-time visualizations are put together quickly and easily to provide simple dashboard summaries of key business parameters and critical information for customers, partners, employees or executive management.

The dashboard visualization's target client machine is MS Windows XP desktop and Internet Explorer and Firefox web browsers. The solution is agnostic to either browser while exhibiting the same performance, look-and-feel and runtime characteristics. This is unlike AJAX-based user interfaces that rely on JavaScript and browser features to render content.

Edge's AppBoard solution provides real-time, meaningful, quick-glance and high density information access regarding the health of critical system services, processes, performance, dependencies, supporting IT infrastructure and the flow of information against all generated events, measurement, and mission data.
